Summer of Research
Project Evaluation Form

This form is intended to support the evaluation of Summer of Research projects across the two program deliverable phases. Part I following submission of the written research report, and Part II during the poster session at the LASIGE Welcome Day. The final section supports the Panel's overall comparison and selection of the projects that most stand out.

Evaluation Guidance:

- Projects should be judged relative to the scope of a less-than-three-month student research experience, and with a focus on student's ability to understand the research framing and goals of their project.
- As a default reference for arriving at the final evaluation, the written report may account for 70% and the poster/presentation for 30% of the combined deliverable score.

Project title: Personalized AI for Parkinson Patients	**Student(s): Ricardo Morais**

Evaluation scale

[1–2] – Insufficient	[3–4] – Limited	[5–6] – Good	[7–8] – Very good	[9–10] – Excellent
Criteria are not adequately addressed	Significant weaknesses or omissions	Criteria are adequately addressed	Strong performance with minor limitations	Outstanding performance for the scope and stage of the project

Research Report

Research Report

Project Title: Personalized AI for Parkinson Patients

Student: Ricardo Morais

Evaluation scale

[1–2] – Insufficient	[3–4] – Limited	[5–6] – Good	[7–8] – Very good	[9–10] – Excellent
Criteria are not adequately addressed	Significant weaknesses or omissions	Criteria are adequately addressed	Strong performance with minor limitations	Outstanding performance for the scope and stage of the project

1. Research Questions and objectives

Consider:

- Is the research problem and objectives clearly formulated?
- Is the contextual motivation and relevance of the work clear?

Score (1-10): 8.5

Comments:

The need for accessible summaries and the risk of unsupported narrative content are clearly motivated. The focus on representation and prompting is appropriate. The research question also asks about safety and clinical efficiency, which the exploratory design cannot establish.

2. Scientific approach and methodology

Consider:

- Is the methodology well-suited to address the stated research question?
- Are methodological choices and technical trade-offs sufficiently justified?
- Are the experimental design, implementation, and data collection procedures sound? (if applicable)
- Are appropriate baselines, controls, or validation mechanisms integrated? (if applicable)

Score (1-10): 7

Comments:

The student specifies the recordings, processing, model, temperature and nine inference runs, and openly treats the detectors as heuristic. This provides a useful exploratory starting point. To compare representations more directly in future work, keep input duration and prompt instructions consistent. Recording full prompts, thresholds and input handling would also help reproducibility.

3. Results and analysis

Consider:

- Are results organized logically and reported with sufficient detail?
- Does the analysis demonstrate methodological rigor?
- Are figures, tables or other representations informative and correctly used?

Score (1-10): 7.5

Comments:

The comparison table and numerical MSSC examples demonstrate useful observed behaviours. Unsupported timestamps and prompt-induced medication framing are identified specifically.

4. Interpretation and discussion

Consider:

- Are the findings/results interpreted critically?
- Does the discussion contextualize the significance of the findings?
- Are unexpected, negative or inconclusive results addressed appropriately?

Score (1-10): 8.5

Comments:

The report clearly distinguishes numerical fidelity from clinical validity and recognises that medication questions originate in the prompt. It discusses limitations thoughtfully and avoids claiming measured safety or usability.

5. Scientific contribution and project development

Consider:

- Does the work represent meaningful progress on the research problem?
- Does the project deliver a concrete output (e.g., methodology, prototype, verified dataset, pipeline, benchmark, or proof-of-concept)?
- Does the work represent meaningful progress given the 3-month project scope?
- Are concrete next steps and technical priorities clearly outlined for future work?

Score (1-10): 8

Comments:

The work delivers a concrete processing and narrative-generation pipeline plus useful observations about representation and prompt risks. This is meaningful exploratory progress within three months. Controlled prompt variants, independent annotation and repeated generations are well-motivated next steps before broader user evaluation.

6. Quality of scientific writing

Consider:

- Is the document organized coherently, adhering to standard scientific paper conventions?
- Is the technical language clear, precise, and objective?
- Is relevant literature appropriately integrated and cited?

Score (1-10): 8.5

Comments:

The writing is clear, coherent and appropriately qualified. Tables, equations and references support the account, and the meaning of overlapping criterion percentages is explained. Reproducibility details could be collected more completely, and terminology in the experimental prompt should better reflect unvalidated algorithmic criteria.

Overall assessment

Overall score for the Research Report	8.0 / 10

Main strengths of the project:

A clear account of a concrete exploratory pipeline, with unusually careful distinctions between sensor descriptors, narrative fidelity and clinical validation. The analysis identifies specific unsupported content and explains how prompt instructions can create misleading interpretations.

Main weaknesses / Areas for improvement:

For the next stage, compare representations using consistent input duration and prompt content, and retain full inputs and outputs for analysis. Repeated generations would help assess stability. Keep the research question and conclusions focused on the exploratory findings, with safety and clinical-efficiency evaluation left as future work.

Questions or points to raise with the student during the poster session:

Which input representation produced the most useful summaries, and why?

What would you change in the prompts to reduce unsupported information in the summaries?

Poster & Presentation

Poster & Presentation

Project Title: _____

Student: _____

Evaluation scale

[1–2] – Insufficient	[3–4] – Limited	[5–6] – Good	[7–8] – Very good	[9–10] – Excellent
Criteria are not adequately addressed	Significant weaknesses or omissions	Criteria are adequately addressed	Strong performance with minor limitations	Outstanding performance for the scope and stage of the project

1. Scientific content of the poster

Consider:

- Does the poster accurately represent the research problem, methods, results and conclusions?
- Has the student selected the most relevant information?
- Is the scientific content consistent with the written report?

Score (1-10): ___

Comments:

_____
_____

2. Synthesis and clarity

Consider:

- Has the student successfully condensed the project into its essential points?
- Can the research question, approach and main findings be understood quickly?
- Is there a clear narrative connecting the different elements of the project?

Score (1-10): ___

Comments:

_____
_____

3. Oral explanation

Consider:

- Can the student explain the project clearly and concisely?
- Does the presentation demonstrate understanding rather than simply reproduce the poster?
- Can the student adapt the explanation in response to the discussion?

Score (1-10): ___

Comments:

_____
_____

4. Scientific understanding and discussion

Consider:

- Does the student demonstrate a strong understanding of the research problem and methods?
- Can they explain and defend methodological choices?
- Can they discuss limitations and alternative interpretations?
- Do they understand the potential impact, contributions and future directions that the project entails?

Score (1-10): ___

Comments:

_____
_____

Overall assessment

Overall score for the Poster & Presentation	____ / 10

Comments:

_____
_____

Final Assessment

Final Project Assessment

1. Overall scientific quality

Consider:

- Taking both deliverables into account, assess the overall quality and rigour of the research conducted.

Score (1-10): ___

Comments:

_____
_____
_____

2. Achievement within the Summer of Research

Consider:

- Considering the three-month duration of the programme and the student's stage of training, assess the significance of what was accomplished.

Score (1-10): ___

Comments:

_____
_____
_____

3. Overall assessment

Consider:

- Consider the project as a whole, including its scientific merit, execution, outputs and the student's demonstrated understanding of the work.

Score (1-10): ___

Comments:

_____

_____
_____

Final evaluation and remarks:
